MECHANISM OF THE NOS. 10 AND 11 REMINGTON

removed by pressing and holding back the feed-roll release key (33740), so that if the edge of the paper is not parallel with the line gage, the side which projects too far may be drawn back. The thinnest or most delicate paper can thus be adjusted without danger of tearing.

THE PAPER FINGERS.—The machine is fitted with two paper fingers (33890 and 33900) and a central line gage (26930). The pressure upon the paper can at any time be increased or diminished by turning the little adjusting screws (74370, Figure 2) to the right or left as may be required. Both paper fingers slide easily upon the paper-finger way bars, and to
